

## SVN Repository for POTUM

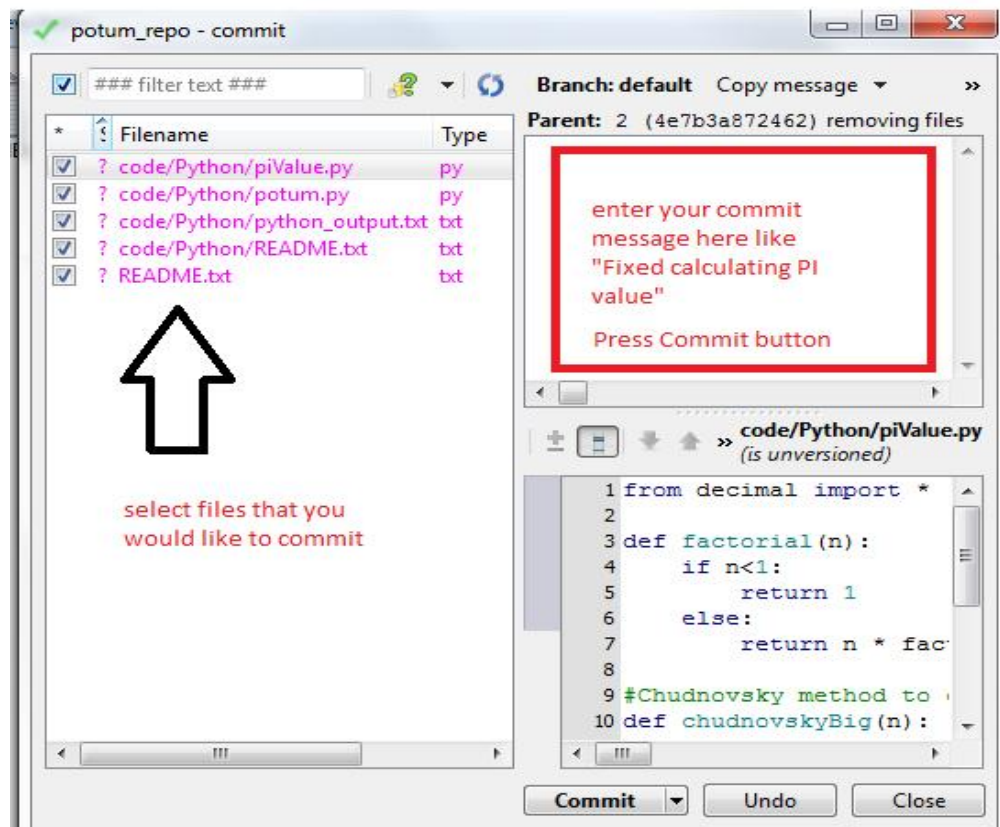

SVN repository has been created at <https://bitbucket.org/> and below is the repository details and steps for using this repository.

Repository URL : [https://marediasafan@bitbucket.org/marediasafan/potum\\_repo](https://marediasafan@bitbucket.org/marediasafan/potum_repo)

Please add your source files in folder like C++, PHP, Matlab and commit every changes so that we do not lose our code and can go back to previous version in case of an issue. **Please accept my invitation that I had sent you to register at bitbucket.org**

Steps to clone repository and add your source files:

1. Download TortoiseHg from here <http://tortoisehg.bitbucket.org/download/index.html>
2. Create a directory say "repository" at your specified location.
3. Open cmd and browse to `cd /path/to/repository`
4. Run command `hg clone https://username@bitbucket.org/marediasafan/potum_repo` (in my case it would be `https://marediasafan@bitbucket.org/marediasafan/potum_repo`)
5. After running clone command a new folder will be created in your repository folder as "**potum\_repo**", inside it you will see code folder where all language code will be placed.
6. Add your language folder inside code like (code/Python) and place all your source files in it.
7. Right click on code folder and then click on Hg Commit. A window will popup like below

8. After committing all your files, you need to push this changes to server by running command

**hg push https://username@bitbucket.org/marediasafan/potum\_repo**

Note: you need to be in potum\_repo directory, so you need to change from your current directory **repository** to **/repository/potum\_repo**

9. Now to update files or code from other team members, go to your **/repository/potum\_repo** folder, right click to open context menu and then **TortoiseHg>Update** . This will keep your files updated to the latest revision of potum repository.
